

# Tidyverse Problem Set

Jingning Yang

September 29, 2019

The purpose of this problem set is to provide data contexts in which to exercise the capabilities of the tidyverse. While some questions require specific answers, other parts of the problems have been written to be purposely ambiguous, requiring you to think through the presentation details of your answer.

## HOLD THE PRESSES!

As I was preparing to post these problems yesterday, I noticed that tidyr had been updated in the last few weeks. I was looking for more exercises on `gather()` and `spread()` – which are always difficult to master. And I found that they have been superseded!! Why do I love working with R as the tidyverse is on a path of continuous improvement? Because the improvements come from developers who write things like this:

*For some time, it's been obvious that there is something fundamentally wrong with the design of `spread()` and `gather()`. Many people don't find the names intuitive and find it hard to remember which direction corresponds to spreading and which to gathering. It also seems surprisingly hard to remember the arguments to these functions, meaning that many people (including me!) have to consult the documentation every time. [Hadley Wickham, Pivot Vignette](#)*

So... before you do anymore tidyverse exercises, Read this [tidyr 1.0.0](#).

Then go to the [tidyr cran page](#) and to the examples and exercises in the new vignettes.

In your solutions to the problems below, if you need to use table reshaping functions from TidyR, be sure that you use `pivot_longer()`, and `pivot_wider()`.

## Problem 1

Load the gapminder data from the gapminder package.

```

The data for Problem 2 is the Fertility data in the AER package. This data is from the 1980 US Census and is comprised of data on married women aged 21-35 with two or more children. The data report the gender of each woman's first and second child, the woman's race, age, number of weeks worked in 1979, and whether the woman had more than two children.
